$$\Phi = \{\textsc{Outline},\ \textsc{Probe},\ \textsc{Evidence},\ \textsc{Draft},\ \textsc{Revise},\ \textsc{Check}\} \quad \text{the six, in run order}$$

$$T = \{\textsc{Close},\ \textsc{Hold}\} \quad \text{the two terminals}$$

COMPILE is not a member. Since 260819 it has no contract of its own, it is folded into REVISE, and no phase routes to it.

$R(\varphi)$ row by row, and the point is that it is **not** uniform: the first three rows are a LOOP that can only leave through one door.

PREPARE – repeats until the plan is self-consistent

$$R(\textsc{Outline}) = \{\textsc{Outline},\ \textsc{Probe},\ \textsc{Evidence},\ \textsc{Draft},\ \textsc{Hold}\}$$
$$R(\textsc{Probe}) = \{\textsc{Probe},\ \textsc{Evidence},\ \textsc{Outline},\ \textsc{Hold}\}$$
$$R(\textsc{Evidence}) = \{\textsc{Evidence},\ \textsc{Outline},\ \textsc{Hold}\}$$

EXECUTE – entered only through OUTLINE's gate

$$R(\textsc{Draft}) = \{\textsc{Draft},\ \textsc{Probe},\ \textsc{Revise},\ \textsc{Check},\ \textsc{Hold}\}$$
$$R(\textsc{Revise}) = \{\textsc{Revise},\ \textsc{Evidence},\ \textsc{Draft},\ \textsc{Check},\ \textsc{Hold}\}$$
$$R(\textsc{Check}) = \{\textsc{Close},\ \textsc{Outline},\ \textsc{Probe},\ \textsc{Evidence},\ \textsc{Draft},\ \textsc{Revise},\ \textsc{Hold}\}$$

Four laws follow from the table, and they are why it is worth printing:

$$\textsc{Close} \in R(\varphi) \iff \varphi = \textsc{Check} \quad \text{only a judge may close}$$

$$\varphi \in R(\varphi) \iff \varphi \neq \textsc{Check} \quad \text{every phase may repeat, not the judge}$$

$$\textsc{Hold} \in R(\varphi) \ \text{ for every } \varphi \in \Phi \quad \text{every phase may stop honestly}$$

$$\textsc{Draft} \notin R(\textsc{Probe}) \cup R(\textsc{Evidence}) \quad \text{the loop's one door out}$$

The two code files AGREE with this table today. The controller (`ref/page-lifecycle.workflow.js`, `LEGAL`) and the auditor (`src/page_lifecycle.py`, `LEGAL_ROUTES`) encode these same six rows: all three PREPARE edges are legal, and neither PROBE nor EVIDENCE routes forward. One residue, documented in both files' own comments: each keeps a COMPILE row and a REVISE → COMPILE edge so an already-stored receipt naming COMPILE stays auditable. No phase contract names those edges.
