

Draw · every page keeps its own drawing

1 Every drawing has one file, and one owner

The files: one drawing per owner, each in its owner's folder.

page drawing	PAGEDIR/draw/PAGEID.excalidraw	the page's own scene
group drawing	GROUPDIR/draw/group.excalidraw	layout + relations over the pages
board map	board.excalidraw	the Index page's overview scene
image bytes	draw/assets/OWNER/	pasted images, kept out of the scene

This part says which file holds which drawing, so you always know what to open. The two page names in that list are different on purpose. The folder is named for the page id plus its slug. The scene file is named for the page id alone. This page sits in `QPf2-draw-attach/` and its scene is `draw/QPf2.excalidraw`. Each page drawing is a plain Excalidraw file, and it is still useful opened on its own. A pasted image is saved under the owner's `draw/assets/`, and the scene keeps a relative path to it. A page with no drawing yet gets an empty scene the first time its Draw split opens. So there is never a missing file to trip over. The group drawing holds only the group's own layout and a list naming each page's scene. It never copies what those scenes contain. `board.excalidraw` stays at the board root as the Index page's overview map. Everything below it follows the new layout: one scene per page, one per group.

2 You draw beside the page, never inside it

The Draw split: the drawing opens next to the page, never inside it.

open	Plugin	Draw, or the Draw tab in the right pane
edit		draw on the canvas; saves go to this page's own scene file
generate		the Draw-it button: Claude draws the page's ## Diagram for you
follow		navigate to another page and the canvas follows it

This part says how to open a drawing, how to edit it, and how to ask Claude to draw it for you. The split names the file it will save to before you draw. So a stroke can never land in another page's scene. The Draw-it button takes an optional ask. Leave it empty, and it turns the page's ascii figure into a real drawing. A drawing Claude made can be drawn again as often as you like. The button refuses to overwrite a drawing a person made by hand.

3 The big group picture is built from the page files, not copied from them

One large drawing from many small ones: what is kept, and what is built for you.

kept	each page's scene . the group's own layer . where each one goes
built	one group view, built again on every open
owner	every shape keeps its owner, so an edit goes back to the right file

This part says the group picture is put together from the page files each time it opens. Opening a group's drawing loads the group scene, pulls in every member page's scene, and places them where the layout says. Inside the group view you work in one mode at a time. You can arrange the pages, edit the group's own layer, or step into one page's scene. Only that owner's file receives the save. Save a page, and the group view shows the change the next time it opens. Nothing is ever merged or pulled in by hand.

4 Two people cannot wipe out each other's work

The safe save: what the server checks before it writes.

```
opened      the revision the editor loaded
save        owner . that revision . the changed elements
[x] accepted the file has not moved since
conflict    someone else saved first . reload and compare
```

This part says every save is checked first, so nobody quietly loses work. Every save carries the version it started from. So two people on the same drawing cannot quietly overwrite each other. The chat pane gets the same owner address as the canvas. So asking chat to change a drawing writes to that drawing's own file.
