The reader who cannot come reschedules before the day instead of missing it · example recipients with an upcoming example appointment (a placeholder audience) · sms · 1 designs a method

Bottom line

Which design goes to the example test? (partly answered) Partly answered, with placeholder results only: j01's kept design (d01 yes-first) went to the example test e01 and came back; j03's kept design waits for a person's release before it can join the next test.

Did the goal-only prediction hold? (answered) Yes, on placeholder numbers: d01's frozen prediction was +1.5 pp [+0.4; +2.6]; the example test e01 returned +1.1 pp [+0.1; +2.1] against the control, in the predicted direction and inside the predicted range.

What was made

3 methods · 1 designs released · experiment results in

Job	method	designs	top design	predicted
j01_confirm-by-reply_goal-only	Goal only	1 released	d01 · yes-first	+1.5 pp [+0.4; +2.6]
j02_confirm-by-reply_goal-only	Goal only	0 released	—	—
j03_confirm-by-reply_overall-performance	Overall performance	0 released	—	—

Predicted: as each method wrote it, against the control; scored in percentage points.

Approved by ✅ 261106, placeholder sign on the example, no person signed, all 1 at once.

One design, traced

> {SENDER}: Reply YES to confirm your appointment on {DAY} at {TIME}. Reply STOP to opt out.

Where it comes from: The ask comes first and the slot right after it: the reply word is the first thing read and the appointment is named; shortest full form (71 characters)

Predicted: +1.5 pp [+0.4; +2.6] against the control, frozen 261106, before anything it predicts was observed.

Tested by: the next experiment; its result is scored against this prediction.
