

eFigure 1: **<Placebo check>: the same model in years with no policy.** Points show each estimate with its 95% interval; the dashed line marks zero; the last point is the policy year. Placeholder figure of Tools' Paper-Example; no real data.

What this display says

In the years before <the policy> the same model finds no effect, so the effect in the policy year is not a trend that was already there.

How this display was made

Data

<The data source>, years <YYYY to YYYY>: the work Run b90.j02.t01.r01, its result/values.csv (placeholder).

Sample

- <who is in it>, as in Display A

Method

The main model refitted with <the policy> moved to each earlier year, where it did not happen; each estimate with its 95% interval. The placebo estimates are placeholders.

Made by

- `r01_example_main/result/values.csv` (the policy-year estimate: main.b, main.ci_lo, main.ci_hi), the Run of

`work/b90_example_paper_results/j02_example_estimates/t01_example_main/`

- `j01_evidence_display/t03_display-c-placebo-check/scripts/draw_placebo_check.py`

Numbers

The policy-year estimate is read from values.csv above; the placebo estimates are fixed placeholders.
