

1 · WHERE A DRAWING LIVES

The files: one scene per owner, each in its owner's folder. Each page drawing is an ordinary Excalidraw file that is useful opened by itself. A page that has no drawing yet gets an empty scene created the first time its Draw split opens, so there is never a missing file to trip over. The group drawing holds only group-level layout and an import list naming each page's scene; it never copies their content.

2 · OPENING, EDITING, AND GENERATING

The Draw split: the drawing opens beside the page, never inside it. The split shows which file it saves to before you draw, so a gesture can never land in another page's scene. The Draw-it button takes an optional ask; left empty, it draws the page's ascii figure as a real scene. A generated scene may be regenerated freely, but the button refuses to overwrite a drawing a person made by hand.

3 · THE GROUP VIEW IS COMPOSED, NEVER COPIED

One large drawing from many small ones: what is stored and what is derived. Opening a group's drawing loads the group scene, pulls in every member page's scene, and places them by the stored layout. Editing inside the composed view happens in one visible mode at a time: arrange the pages, edit the group's own layer, or enter one page's scene; only that owner's file receives the save. A page save updates the composed view on its next open; nothing is ever merged or imported by hand.

4 · SAVES ARE CHECKED, NEVER BLIND

The safe save: what the server verifies before writing. Every save carries the revision it started from, so two people editing the same drawing cannot silently overwrite each other. The chat pane receives the same owner address as the canvas, so asking it to change a drawing routes to that drawing's own file.
