

The design theme on the ladder

N designs for one goal, by one method: how we make them, check them and learn from them

Today we cannot say why a design changed

- Design work sits in stage folders: a brief, the principles, then one Design folder per method.
- A method folder holds every goal, so the goal, the method and the inputs change together.
- When a new batch of designs reads differently, nobody can name the one cause.

Today

- 0-BR-brief/ · 1-P-principle/ · 2-Design-M<NN>/
- a method folder holds every goal
- Runs: commission · generate · verify

On the ladder

- Block → Job → Task → Run
- a Job pins one goal, one method version, one inputs version
- every Run is named run-<type>-<target>

A design method is a frozen recipe: a goal and inputs in, N designs out

- Each method version is frozen, so two Jobs on the same version are comparable.
- It runs in five steps, and checking a design is always another agent's work.
- Thirteen method cards in three families say where the rule comes from: the goal alone, research, or our own data.

Four levels: Block, Job, Task, Run

- A Block is one application and one channel: its goals, its inputs versions and what the Exps returned.
- A Job is one goal done by one method version on one inputs version, returning N designs.
- A Task is one step of the method, and a Run is one piece of work inside it.

One change per Job, so every difference has one cause

- A new goal, a new method version or a new inputs version each starts a new Job.
- To compare two methods, run sibling Jobs on the same goal and the same inputs.
- The Block's Map lays goals against methods, and each cell holds its chain of Jobs.

	M01 by goal	M03 by insight	M04 by insight
G01 <goal>	j01 · i1	j02 · i1 → j05 · i2	j03 · m2 · i2
G02 <goal>	—	j04 · i1	j06 · m2 · i1
G03 <goal>	j07 · i2	—	—

A row is one goal's history: each → is a new Job that changed one thing. A column is one method across goals.

Inside one Job: set up, reason, make, check, rank, release

- Three set-up Runs pin the goal, the method version and the inputs.
- t00 reasons out 15 ideas, and each idea becomes its own design Task.
- Each design is generated, verified by another agent, and revised until it passes.
- t99 ranks the 15, keeps 10 with a prediction each, and a person releases them.

Four guardrails keep the designs honest

- None of them relies on the maker checking its own work.

Inputs fence

- The Job sees only its inputs/ folder.
- A manifest pins each file by its hash.
- Each reasoning step cites a file, or says own knowledge.

Another agent checks

- Verify and rank run in a separate reviewer agent.
- A failed check sends the design back to revise.

A person decides

- A person signs each goal once, at the Block.
- A person releases the designs; nothing ships on its own.

Predictions frozen

- Each kept design carries a predicted effect.
- It is frozen at release, before the Exp runs.

The Exp teaches the method, not only the designs

- The Exp runs outside the theme, and only per-arm totals come back, never rows.
- Each released design's frozen prediction is scored against its arm.
- Scores add up to a scorecard per method version, and its weak spots become proposals for the next version.

Insight steers design through one handoff

- An insight Block's signed Wisdom answer is the only crossing between the two Blocks.
- It enters the design Block as a new inputs version.
- Jobs whose method reads our data use it, and each design element names where it came from.

One workbench: the same six Spaces at every level

- Block, Job and Task each show the same six Spaces, and what a Space holds follows the level.
- At the Task level, the Task's run types decide what each Space shows.

Space	Block	Job	Task
Description	Map · Goals · Methods · Inputs	its goal, method and inputs	what it reads and returns
Audience Report	Questions · Cost · Predicted vs observed	Ideas · Designs · Ranking	Tests · Drafts · Performance
Work Details	one card per Job	t00 · t01 – t15 · t99	Chains · Elements · Kept
Runs	set up · launch · report	set up · reason · make · rank	its own Runs
Delivery	every released design	the kept designs	what it hands on
Idea Studio	drawings	drawings	drawings

Where it stands

- Next: the workbench serves all three levels, then the older design Boards carry over.

Done

- The skills carry the ladder: contract, inputs and methods, worker, Runs and release.
- 95 tests pass, and one Job runs end to end.

In progress

- The workbench screens for Block, Job and Task on the new ladder.

Open

- Token usage in each Run's receipt.
- The Exp names the Job and design on each arm.
- Carrying the older design Boards over.
