

1 · THE SELECTION RECORD · A PAGE-TYPE LOST, A PLUGIN WON

****The candidates****: what owning a talk costs a board.

JL 260815: "We will not have a page-type of slide, the slide will just be the plugin version, which means every page will have a slide (optional)."

A lost the way every artifact-shaped kind lost: a page per deck is a page that decides nothing, and its divisions mirror the slides the way the mirror kind mirrored a SKILL.md.

This is the third kind to reduce to material: for-skill became the skill/ plugin, for-meeting became meeting/, and for-slide becomes slide/.

The base selection that retired the mirror kind is recorded on Design-3 Content §2, and this page adopts it.

Disposition of **A**: the QBt9 specimen is archived whole at `_archive/QBt9-for-slide.md`, its scripts-free deck mechanics, acceptance model, and three recorded contract conflicts intact; the haipipe-page-for-slide unit's retirement rides the family reorg.

2 · THE DECK IS THE AI DECK

****Three tiers became one****: what each tier was, and why only the authored one survived.

JL 260815: "We will just have the AI deck."

The retirement is in the engine, not in prose: 70-plugin-slides.js no longer cuts the DOM or posts to `/_board/deck`, and the shell's Slides tab shows the saved file or a pointer, never a generated copy.

Six authored decks exist as of the ruling hour: QA0, QA00, QPf2, QPf4, Design-3, Design-6.

3 · THE ONE HOME AND THE TWO DOORS

****Where a deck lives and how it opens****: derivation, not registration.

Both doors HEAD the derived path: a saved deck shows, a missing one yields the pointer page naming the author path.

The deck links at html-ppt's own assets by relative path, so the same file opens over the server and off disk, and a theme improvement reaches every deck without a rebuild.

4 · WHAT THE DEAD TYPE HAD THAT THE PLUGIN DOES NOT

****The acceptance gate****: the one idea worth carrying out of the archive.

The QBt9 specimen's law was that a person accepts each rendered slide, and no machine may tick that row.

An AI deck makes editorial choices, so it CAN misrepresent its page, and the plugin path currently has no acceptance surface at all.

Whether a deck presented to others needs a person's yes first is not ruled, and the aim below holds the question rather than letting it vanish with the type.
